Appendix S2: Results of local toxicology and medication tests in blood and urine samples obtained on arrival of the patient at Charité – Universitätsmedizin Berlin (day 3). A hair sample obtained on day 4 confirmed the presence of several of the compounds detected in blood and urine and, in addition, revealed the presence of Tropicamide. Results of toxicology analyses conducted in a special laboratory of the armed forces are not included.

Appendix S3. Repetitive determination of the cholinesterase status in patient blood.⁴ The timeline is given in days after the supposed poisoning of the patient. (A) RBC-AChE activity in whole blood dilutions (AChE in vivo) and after incubation of whole blood dilutions with 100 μM obidoxime ex vivo (reactivability). (B) The presence of a cholinesterase inhibitor was determined by incubation of patient plasma with test AChE (inhibitory activity).
